

## 1. DEEP OPEN WATER

The Musk Duck is a very dark bird which feeds almost entirely by diving for vegetation, insects and crusteans. It rarely comes to land. In display, the male throws jets of water into the air with a backward kick, expands its bill flap and utters a shrill whistle which can often be heard.

The Australia Shoveler can be distinguished by its large black spoon-like bill. The male has a blue-grey head and prominent white flank-mark. They feed by filtering mud and water for small animals.

The Grey Butcherbird feeds mainly on insects, small reptiles and nesting birds. The name 'butcherbird' comes from its habit of impaling prey on a thorn or in the fork of a tree and tearing off the meat. They have a beautiful piping voice and sometimes sing in duet.

The Australasian Grebe is a small, round bird that can be seen frequently diving and appearing some distance away. It dives for food and also for protection. Note its black head and neck and pale yellow face spot.

## 3. WET FRINGING TYPHA AND REEDBEDS

The Clamorous Reed-Warblers the outstanding summer singer of the reedbeds. Listen for its call 'chutch church, dzee dzee, quarry quarry'. You will have to watch quietly for this secretive plain brown bird which can often be seen perched sideways on reed stems. It feeds on insects and aquatic animals.

The Rufous Whistler is often sighted in the trees. The male can be easily identified by the black band which separates the white throat and rufous underparts. It has a loud, spirited song.

## 2. OPEN SHALLOW WATER

The Pacific Black Duck can often be seen upending in shallow water to reach small plants. It is more brown than black with a black and white striped face.

The White-faced Heron may be seen in shallow water among the reeds, stalking prey. It has a white face, grey body and long yellow legs.

The Grey Fantail is a friendly bird that can be seen (tilting and fluttering through trees and on the ground as it hawks for insects. It is conspicuous by its grey and white tail which it continuously spreads and closes.

The Eurasian Coot is recognizable by its white bill and forehead. They feed on water plants and also visit the picnic area for food. Look for the lobes on their toes which replace webbed feet for swimming

## 4. UPLAND BANKSIA WOODLAND

The New Holland Honeyeater is a boldly streaked black and white honeyeater with white eyes and a yellow panel on the wing. It has a long, blackish curve) bill. They are often seen feeding in parties on nectar and insects.

## 6. MUDFLATS AND VERY SHALLOW WATER

During summer months waders come to feed on the mudflats as the water level drops. Some of these waders fly to breeding areas in northern Asia during our winter. One of these is the Common Greenshank which has a long, dark, slightly upturned bill, grey above and long, dull-green legs. They feed by jabbing their bills into the mud in search of food.

The **Black-winged Stilt** can be easily identified by their long pink legs and long needle-like bill which they use to probe in the mud for food. These waders breed in Australia.

## 7. INUNDATED MELALEUCA TERITIFOLIA THICKETS

The **Rufous Night Heron** can sometimes be seen sleeping in the melaleuca bushes. It has a black head and beak and colourful rufous back. At dusk it sets out to feed.

The **Purple Swamp-hen** uses its long unwebbed toes to clamber through thickets of reeds searching for young reed stems, frogs and molluscs.

Note the bright red bill and headshield. They are very common in most habitats at Bibra

## 8 FRINGING PAPERBARK WOODLAND

A party of bouncy, tinkling, small **Yellow-rumped Thornbills** can be seen moving along the ground, close to bushes for protection and feeding on seeds and small insects. Look for their bright yellow rumps as they (lit along

The **Magpie Lark** is neat-looking, black and white bird with a prominent white eyebrow. They are usually in pairs or small parties feeding on the ground on small animal food. Their nest is bowl-shaped and made of mud. Their call 'Pee-wit' is often heard.

## 9. BIRDS OF THE AIR

You will see **Swallows** gracefully cruising in the air catching insects on the wing. You will also see **Tree Martins** flying among the Swallows. See if you can identify these two birds, one with a white rump and one with a rufous breast

The **Marsh Harrier** is a dark brown bird with a distinctive white band at the base of its tail and yellow legs. It sails low over fringing vegetation and mudflats on upswep wings in search of small animals

## 10. BIRDS OF THE PICNIC AREA

Many birds come to be fed at the picnic area. They include such feral waterfowl as Mallard, Muscovy and Mallard-Pacific Black hybrid ducks and domestic geese.
